

# EXEBENUS

The background image shows an offshore oil rig at sunset. The sky is a mix of blue, orange, and white clouds. The rig's yellow structure is prominent in the center. In the foreground, there are dark, crisscrossing cables or ropes. A large white diamond shape is superimposed over the center of the image, with its vertices pointing towards the corners. The text 'EXEBENUS' is in the top left, 'EXEBENUS PULSE®' is in the middle left, 'CASE STUDIES' is in the bottom left, and '31 May 2021' is in the bottom left corner.

## EXEBENUS PULSE®

### CASE STUDIES

### PLANNER

<b>Perforate 9-7/8" Liner at +/- 5,720' MD on TCP</b>
P/U TCP Assembly
TIH w/ TCP to 5,720
Correlate Guns on depth
P/U Flow Head / Test to 5,000 psi
Establish circulation

### SID

#### Operations

1. **Perforate 9-7/8" Liner at +/- 5,720' MD**
  - A. Hold JSA to cover running TCP assembly. Document on IADC.
  - B. M/U TCP gun assembly for B lower perforation.
    - Flow check well prior to TIH.
    - 60 fpm max trip speed.
  - C. Place TCP gun on depth at +/- 5,720' MD (5,825' DPM) and mark pipe.
    - Apply right hand rotation and set Champ Packer with 20K weight down. Mark pipe with packer set position.
    - Confirm top valve on flow head is closed. Insert Drop Bar into 15' pup on top of flow head.
    - Make up surface flow control head and surface lines.
    - Close annular and ensure lower valve on flow head is open. Apply 300psi to annulus. Slowly strip up to open packer bypass. When pressure bleeds to zero, bypass is open. Mark pipe with Bypass Open position.
    - Pressure test flow head and surface lines.
      - Close lower valve on flow head and pressure test surface lines to 5,000 psi for 5 minutes.
        - Acceptance criteria is 2.5% pressure loss over 5 minutes with a decreasing pressure loss trend.
      - Bleed off pressure and open lower valve on flow head.
  - D. Establish circulation and record pressures at the following rates as a baseline:
    - 1 bpm \_\_\_\_\_ psi
    - 2 bpm \_\_\_\_\_ psi
    - 3 bpm \_\_\_\_\_ psi
    - 4 bpm \_\_\_\_\_ psi

### EXEBENUS PULSE

Operation	Expand all	On
1. Meeting Pre-job safety meeting		
1.1 Pre-job safety meeting Hold JSA to cover running TCP assembly. Document on I...		
2. Run in hole Run in hole		
2.1 Make up TCP gun assembly for B lower perforation.		
2.2 Flow check - static well prior TIH.		
2.3 Trip in		
3. Prepare Prepare		
3.1 Set - mechanical apply right hand rotation to set Champ packer down.		
3.2 Make up surface flow control head and surface lines.		
3.3 Close annular and ensure lower valve on flow head is open.		
3.4 Pressure up - cement pump annulus.		
3.5 Observe pressure drop - cement pump when slowly stripping up to open packer ...		
4. Pressure test Pressure test surface lines		
4.1 Pressure - cement pump surface lines.		
5. Circulate Circulate		
5.1 Circulate stage up and record pressure at the following rate.		

# Example

## Lack of consistency

### RIG TEAM A

#### Operational risks

- Alternations of plans.
- Focus on ECD
- Hole cleaning/washouts
- Well control
- Stuck pipe

#### HSE risks:

- Respect barriers/Red zone on drill floor.
- Work on two levels is not allowed if any risk of falling objects to lower level.
- Ensure good communication between all involved parties.
- Use of manual tools, slips, dog collar etc.

### RIG TEAM B

#### Major risks

- Tool failure
- OBM spill to sea, OBM cutting handling & weather
- Hole instability
- Getting stuck/hanging up at shoe
- Packoff
- Stringers & vibrations
- Losses

## Example

# Best practice

### 1 PROCEDURE

Condition the LSOBM prior to pumping displacement.  
Circulate minimum 1,5 x BU at as high rate as possible with max 120 bar SPP. (Simulations indicate 1000 – 1500 lpm)

### 2 PROCEDURE

- Condition LSOBM prior to pumping displacement.
  - Circulate min. 1.5 x BU at **750 lpm**.
  - **Max rotation 40 rpm**.

### 3 PROCEDURE

- Condition LSOBM prior to pumping displacement.
  - Circulate min. 1.5 x BU at **750 lpm**.
  -

The example is taken from a lower completion run that had to be re-run 3 times in 1 week due to a fish in the hole.

### ACTUAL

Rig Circulated with 1100 lpm/100 bar thus optimum circulation rate would be about 1500 lpm.

### LOST TIME

Loss of rig time:	45 min
Potential loss of rig time:	2 hours

### ADDITIONAL RISK

Rig crew loose confidence in procedure  
operational constraints

# Example

## The value of tagging

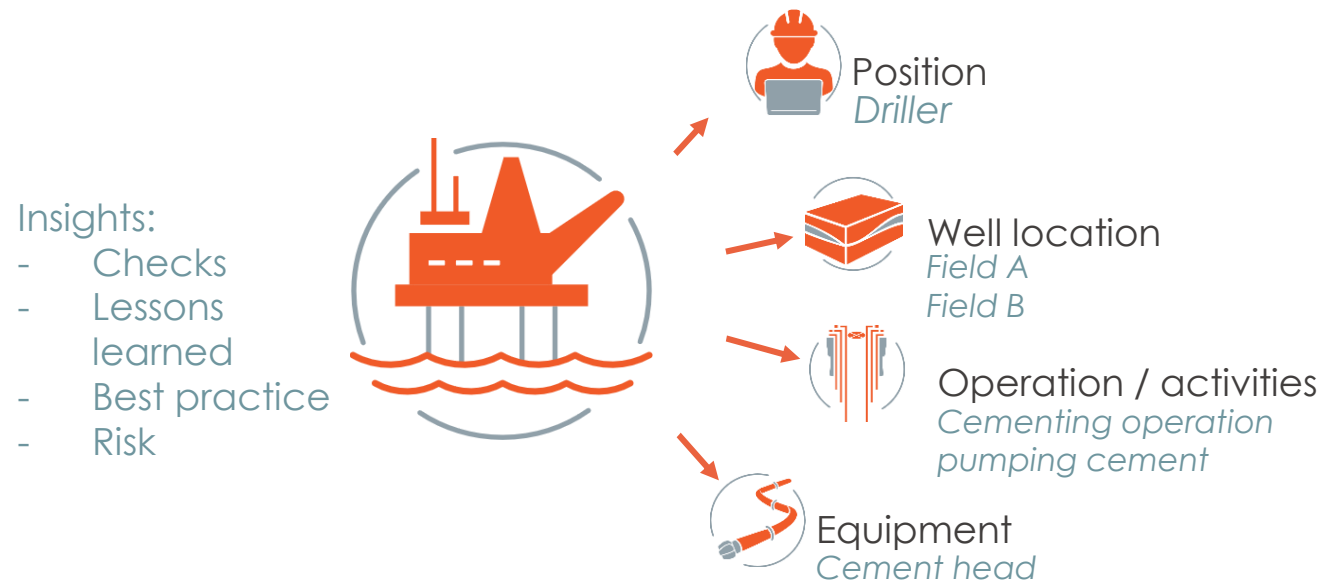

How would the same operation change... if you chose a different equipment supplier ... same operation on a different rig?

Equipment related

- Activities: ~ **60%**
- Checks: ~ **40%**
- Risks: ~ **27%**

Activities related

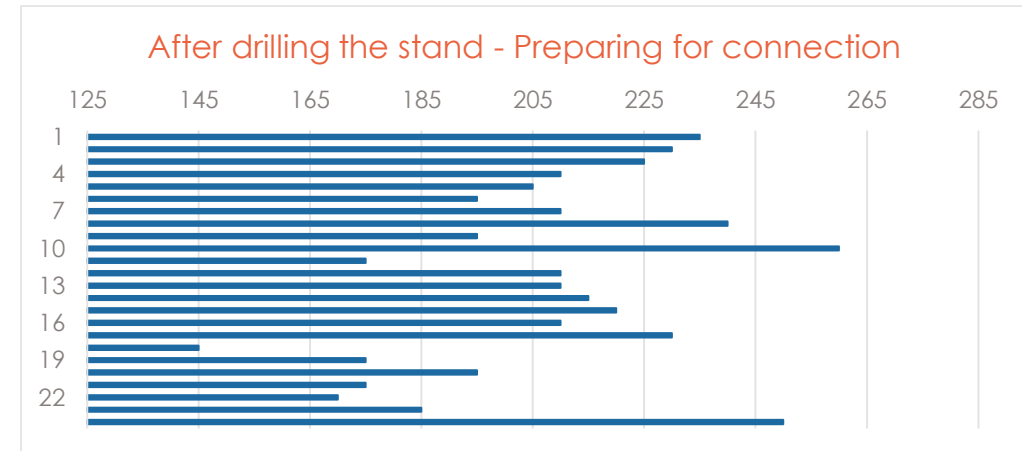

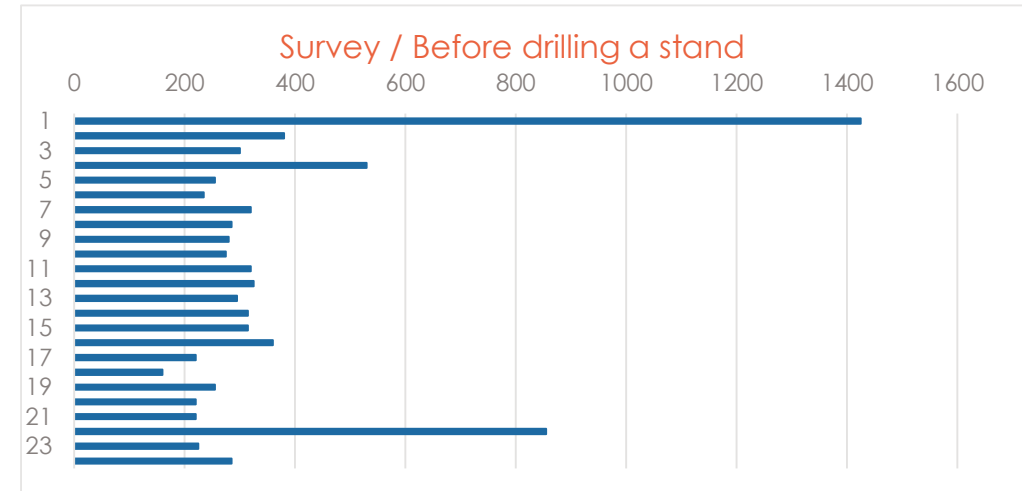

- Checks: ~ **50%**
- Risks: ~ **8%**

### USE CASES

# USE CASES

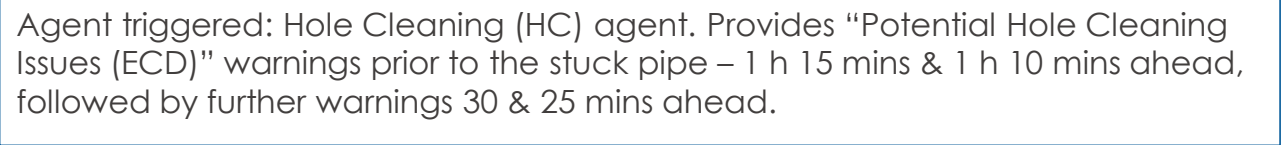

## Case 1

# Warnings and alarms before stuck liner

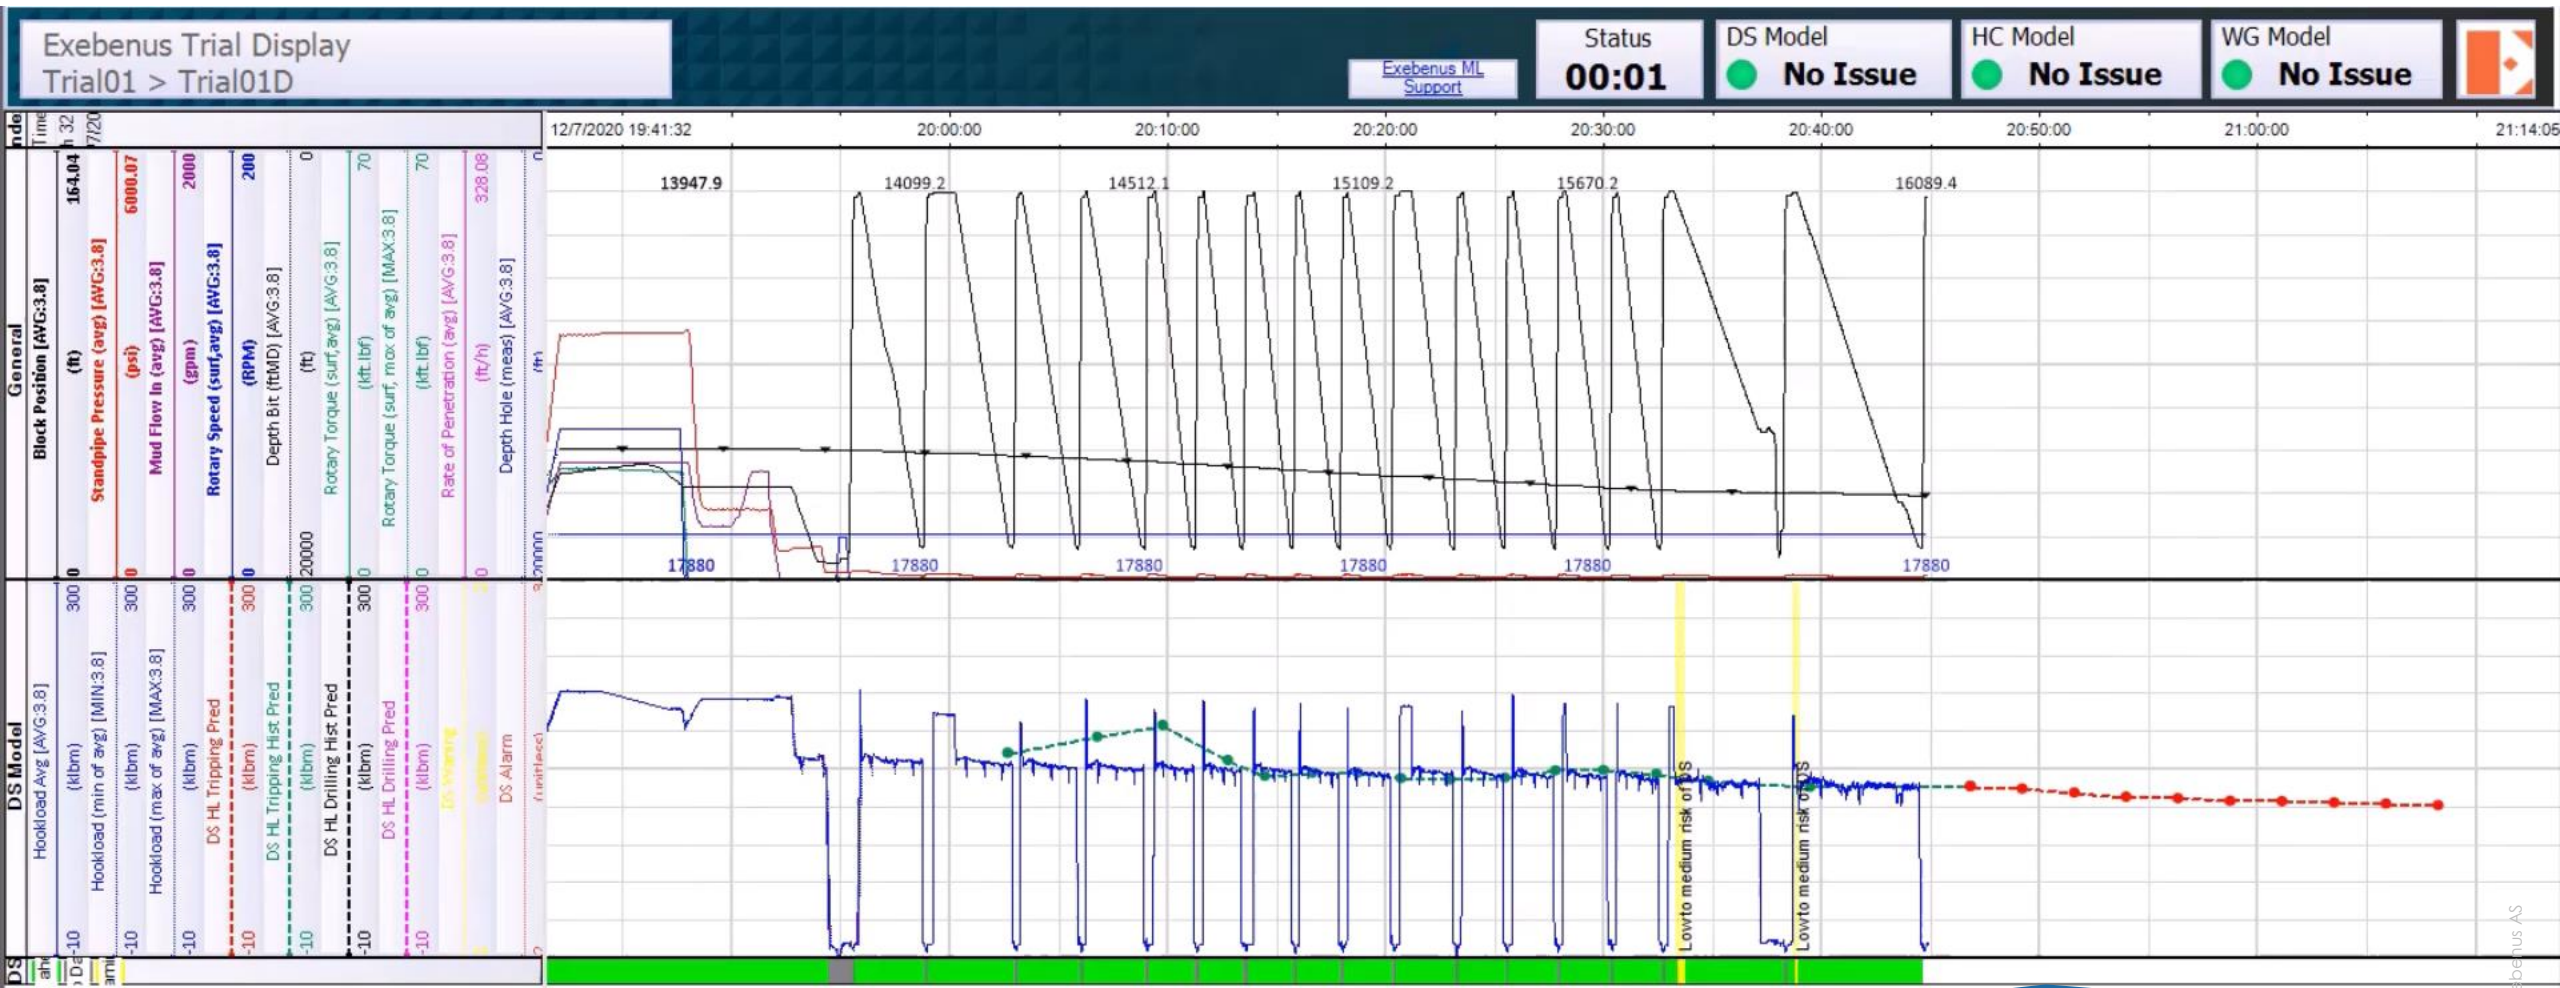

Copyright © 2021 Exeбенus AS

# Case 3

## TIH 8 1/2" x 9 1/2" Drill assembly, multiple DS warning/alarms prior tight spots

**Agent triggered:** Differential Sticking. **Time prior event:** 1/2 hour  
Event occurred at bitdepth 16600ft. Differential (3) warning & (3) alarms triggered before tight spot

**Scenario:** Tripping in hole w 8 1/2" x 9 1/2" drill assy. Took weight at 16600 ft, 40 klbs down weight. Rotate past tight spot. Fill string. More tight spots further down. Managed to work pipe to 17892 ft. Jarring and pipe eventually stuck. Liner shoe at 16056 ft.

# Customer engagement levels

## Demo

The purpose of a live demo is to show case and discuss some of the key capabilities of Exebenus Current ML agents in interaction with you.

01

## Trial

With a minimum risk, cost and exposure we trial Exebenus Current ML agents using your historical WITSML data.

02

## Pilot

Perform live tests on processes and capabilities of Exebenus Current ML agents on your own live data. We will provide introduction training for selected users.

03

## Implementation

During a few weeks Exebenus Current ML Agents is setup and integrated with your company's standards and processes.

04
